AB A review. Phytoplankton or micro algae is a diversified, sustainable and ecol. source of innovative ingredients for **cosmetics**. The authors introduce 3 species that help relieve the **skin** from various stresses and restore homeostasis: *Phaeodactylum tricornutum*,

Porphyridium cruentum, and Skeletonema costatum.

AB The invention concerns the cosmetic use, by topical application on the skin, of at least a steroid selected among 7OH-DHEA and its chemical derivs., as slimming agent, in particular for preventing and/or treating cellulitis or orange peel skin and/or for refining the face contours. The invention also concerns a composition containing, in a physiol. acceptable medium, at least a steroid such as defined above and at least a lipolytic and/or lipogenesis inhibiting agent other than said steroid. Formulation of a gel containing 0.5% 3-O-acetyl-7-benzoyloxy-DHEA is disclosed.

AB The invention relates to a novel lipid extract of the algae **Skeletonema**, especially the algae **Skeletonema** costatum. In particular, this extract is a total lipid extract of said algae. It can be obtained by extracting the algae **Skeletonema** in an organic solvent which has a polarity index p' of less than about 5.4, preferably of between 2 and 4.5 and particularly preferably of between 4.2 and 4.4, and which is acceptable in the cosmetic or pharmaceutical industry. This extract can be used as an active principle for the manufacture of a cosmetic or pharmaceutical composition particularly for producing a slimming, anti-cellulite, skin anti-ageing or sensitive skin treatment.

AB The present invention relates to cosmetic compns. comprising the following: an active ingredient such as at least one substance that promotes intercellular communication of **skin** cells, especially keratinocytes, and fibroblasts and pre-adipocytes of the **skin**; the use of at least one substance promoting intercellular communication of keratinocytes, fibroblasts and pre-adipocytes of the **skin** as a **cosmetic** agent, optionally in the presence of a cosmetically acceptable vehicle; a method for promoting and/or increasing the activity of a **cosmetic** agent acting directly in the cell or via second intracellular messengers, and a method for treating ageing of the **skin** using **cosmetics**. Alc. extract of **Skeletonema** costatum was prepared and its enhancing effects on intercellular communication of cultured **skin** keratinocytes was studied.
 Formulation of a cream containing 1% S. costatum extract is disclosed.

AB The invention is a dermatol. healing kit having a pigment stabilizer component and an anti-inflammatory emollient component, wherein the pigment stabilizer contains a mixture of glycerin, butylene glycol, bearberry extract, and Mitracarpe extract; Mg ascorbyl phosphate; and Tricholoma matsutake singer; and the anti-inflammatory emollient component contains Zanthoxylum bungeanum; decarboxy camosine chlorhydrate; Polygonum multiflorum thumb; Rubus thunbergii; and an aqueous mixture of Siegerbeckia orientalis extract. The kits are effective for treating damage to and discolorations of laser-treated, ablated **skin** surfaces, and thus for the faster elimination of erythema from surface inflammation, for the moisturizing the **skin**, and for preventing and/or counteracting the darkening of **skin** faster than was heretofore possible.

AB The HPLC separation of fluorescent o-phthaldialdehyde (OPA) derivs. has been applied to the assay of free amino acids from five microalgae commonly used in aquaculture: Tetraselmis suecica, **Skeletonema** costatum, Chaetoceros calcitrans, Thalassiosira sp. and Isochrysis galbana, as part an assessment of their potential use in **cosmetic** products. Thirteen free amino acids were analyzed using high performance liquid chromatog. There were considerable differences between species. However, four amino acids were responsible for more than 60% total concentration in all species: Asp, Glu, Arg and Tyr; the next most important (accounting for less than 30%) were: Ala, Val, Phe and Lys.

AB There are around 110 commercial producers of microalgae in the Asia-Pacific region, with annual production capacity ranging from 3 to 500 T. About nine-tenth of the algal cultivation plants are located in Asia. The commercially cultivated microalgae include Chlorella, Spirulina, Dunaliella, Nannochloris, Nitzschia, Cryptocodinium, Schizochytrium, Tetraselmis, **Skeletonema**, Isochrysis and Chaetoceros. Most of the commercially produced algal biomass is being marketed as health food, in the forms of tablets and capsules. Algae and their extract are also included in noodles, wine, beverages, breakfast cereals and **cosmetics**.

Q R 861 P 45

proportion of the total lipids in *Tetraselmis suecica*, *Porphyridium cruentum* and *Isochrysis galbana*, comprising 20.9, 17.1 and 17%, resp. Arachidonic and linolenic acids were the most abundant PUFA in *T. suecica*. *Skeletonema costatum*, *Chaetoceros calcitrans*, *P. cruentum* and *Nannochloropsis* sp. had a high content of eicosapentenoic acid. The amts. of linoleic, octadecatetraenoic and docosahexaenoic acids found in *I. galbana* were notable. The high PUFA content of most of these microalgae make them good potential raw materials for cosmetic upgrading.

PRIORITY APPLN. INFO.: FR 1991-14120 19911115

AB Title grains are prepared, which may incorporate polyvalent metal salts, marine organisms or their exts., enzymes, etc. As aqueous solution containing κ-carrageenan 3, Me paraben 0.20, and *Chlorella* culture concentrate 1.00%, was dripped into a coagulating solution, to give gel grains, which were incorporated into cosmetics, such as creams or lotions.

AB Vitamin, free amino acid and fatty acid analyses were carried out on selected different microalgal species used in aquaculture as an evaluation for proposed cosmetic use. In most cases, greater amts. of vitamins were obtained in the microalgae than in the usual human food sources. On a dry weight basis, tyrosine, alanine and glutamic acid were the main free amino acids found in the strains studied. Considering fatty acids and total lipid, the ratio of polyunsatd. fatty acids (PUFA) to saturated fatty acids remained nearly constant for the species analyzed and

PUFA

were dominant. For both *Chaetoceros calcitrans* and *Skeletonema costatum*, myristic and palmitic acids were the main saturated acids and EPA the major unsatd. acid, but for *Tetraselmis suecica* palmitic acid represented 29.4% of the total fatty acids. This species also contained oleic, linoleic and octadecatetraenoic acids.

AB On exposure to UV radn., the phytoplankton *Emiliana huxleyi* and
Skeletonema menzelsii metabolize 7-dehydrocholesterol to previtamin
D₂, which can enter the marine food chain. Lipid exts. of cod, flounder,
and trout liver contain vitamin D₃ as the major vitamin D. Although trout
skin, on exposure to UV radiation converts provitamin D₃ to
previtamin D₃, this is not the major source of vitamin D₃ for most fish.
Vitamin D₃ is present in trout blood serum and may possibly be converted
to vitamin D hydroxylated metabolites. There are no known metabolic
functions of vitamin D in fish and phytoplankton. However, the
 λ_{max} of previtamin D and tachysterol are almost identical to the UV
absorption of nucleic acids and proteins, resp., suggesting that
provitamin D and its photoproducts evolved as natural sunscreens to
protect RNA, DNA, and proteins from UV damage.
